TLV320AIC3256 Ultra Low Power Stereo Audio Codec With Embedded miniDSP

1 Features

- Stereo Audio DAC with 100dB SNR
- 5.0mW Stereo 48ksps DAC-to-Ground-Centered Headphone Playback
- Stereo Audio ADC with 93dB SNR
- 5.2mW Stereo 48ksps ADC Record
- PowerTune™
- Extensive Signal Processing Options
- Embedded miniDSP
- Six Single-Ended or 3 Fully-Differential Analog Inputs
- Stereo Analog and Digital Microphone Inputs
- Ground-Centered Stereo Headphone Outputs
- Very Low-Noise PGA
- Low Power Analog Bypass Mode
- Programmable Microphone Bias
- Programmable PLL
- 5mm x 5mm 40-pin QFN Package or 3.5mm x 3.3mm 42-ball WCSP

2 Applications

- Portable Navigation Devices (PND)
- Portable Media Player (PMP)
- Mobile Handsets
- Communication
- Portable Computing
- Advanced DSP algorithms

3 Description

The TLV320AIC3256 (also called the AIC3256) is a flexible, low-power, low-voltage stereo audio codec with programmable inputs and outputs, PowerTune capabilities, fully-programmable miniDSP, fixed predefined and parameterizable signal processing blocks, integrated PLL, and flexible digital interfaces.

Device Information(1)

PART NUMBER	PACKAGE	BODY SIZE (NOM)
TLV320AIC3256	WQFN (40)	5.00 mm x 5.00 mm
	DSBGA (42)	3.49 mm x 3.29 mm

(1) For all available packages, see the orderable addendum at the end of the datasheet.

4 Simplified Block Diagram

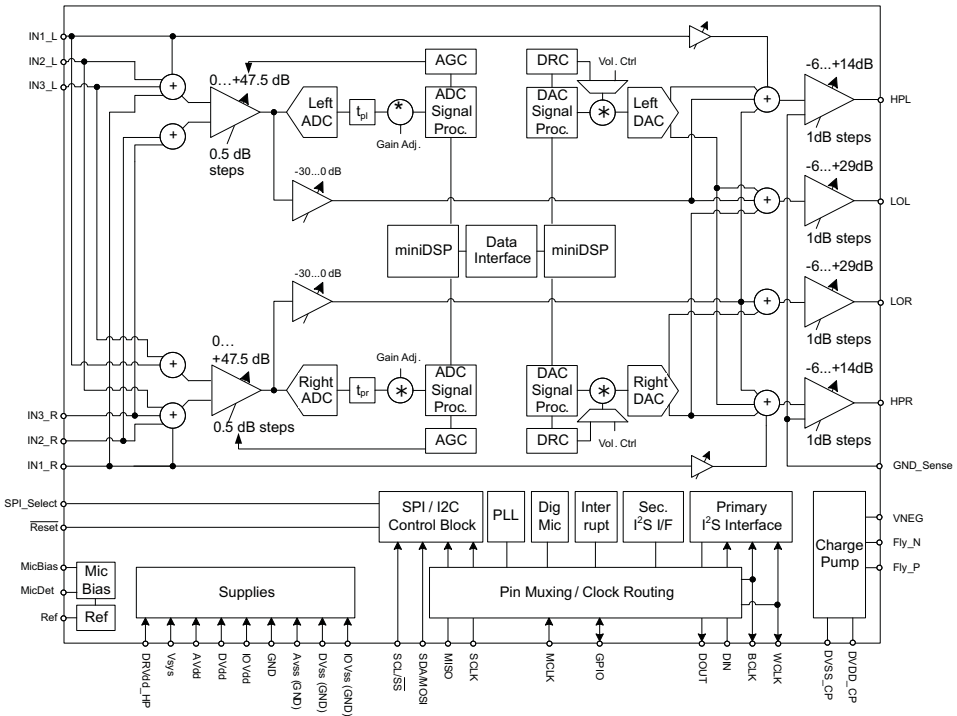

Table of Contents

5 Revision History

NOTE: Page numbers for previous revisions may differ from page numbers in the current version.

Changes from Revision B (January 2013) to Revision C **Page**

- Added the Device information table, Handling Ratings table, Applications and Implementation section, Layout section, and the Device and Documentation Support section ... 1
- Deleted "Acoustic Echo Cancellation (AEC)" and "Active Noise Cancellation (ANC)" from applications list ... 1
- Added Note 1 to the Pin Functions table ... 5
- Added "Audio input mux ac signal swing" to the Recommended Operating Conditions table ... 8
- Added the Digital Microphone PDM Timing (see Figure 5) section ... 19

Changes from Revision A (December 2010) to Revision B **Page**

- Added WCSP package (YZF) ... 1
- Updated block diagram to include Vsys pin ... 1
- Updated diagram to include Vsys pin ... 37
- Updated power supply section to include Vsys ... 41

6 Device Comparison Table

PART NUMBER	DESCRIPTION
TLV320AIC3254	Low power stereo audio codec with miniDSP.
TLV320AIC3204	Same as TLV320AIC3204 but without miniDSP.
TLV320AIC3256	Similar to TLV320AIC3254 but with ground centered headphone output.
TLV320AIC3206	Same as TLV320AIC3256 but without miniDSP.

Pin Functions (continued)

PIN		WCSP (YZF) BALL NO.	TYPE[1]	DESCRIPTION
NAME	QFN (RSB) NO.			
IN3_L	24	F5	AI	Multifunction analog input, Single-ended configuration: MIC3 or Line 3 left, Differential configuration: MIC or Line left, positive, Differential configuration: MIC or Line right, negative
IN3_R	25	F4	AI	Multifunction analog input, Single-ended configuration: MIC3 or Line 3 right, Differential configuration: MIC or Line left, negative, Differential configuration: MIC or Line right, positive
LOL	26	G3	AO	Left line output
LOR	27	F3	AO	Right line output
GND_SENSE	28	E3	AI	External ground reference for headphone interface –0.5V to 0.5V
AVdd	29	G2	PWR	Analog voltage supply 1.5V–1.95V
Vsys	30	G1	PWR	Power supply 1.5V–5.5V, Vsys must always be greater than or equal to AVdd and DVdd (Vsys ≥ AVdd, DVdd)
HPL	31	F1	AO	Left headphone output
DRVdd_HP	32	F2	PWR	Power supply for headphone output stage Ground-centered circuit configuration, 1.5V to 1.95V Unipolar circuit configuration, 1.5V to 3.6V
HPR	33	E1	AO	Right headphone output
MICDET	34	E2	AI	Microphone detection
VNEG	35	D1	PWR	Negative supply for headphones. –1.8V to 0V Input when charge pump is disabled, Filtering output when charge pump is enabled
FLY_N	36	D2	PWR	Negative terminal for charge-pump flying capacitor
DVss_CP	37	D3	GND	Charge pump ground
FLY_P	38	C2	PWR	Positive terminal for charge pump flying capacitor
DVdd_CP	39	C1	PWR	Charge Pump supply; recommended to connect to DVdd
DVdd	40	B1	PWR	Digital voltage supply 1.26V – 1.95V
Thermal Pad	Thermal Pad	N/A	N/A	Connect to PCB ground plane. Not internally connected.

8 Specifications

8.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted) [1]

	MIN	MAX	UNIT
AVdd to AVss	–0.3	2.2	V
DVdd to DVss	–0.3	2.2	V
Vsys to DVss	–0.3	5.5	V
IOVdd to IOVss	–0.3	3.9	V
Digital Input voltage	IOVss	IOVdd + 0.3	V
Analog input voltage	AVss	AVdd + 0.3	V
Operating temperature range	–40	85	°C
Junction temperature (T_J Max)		105	°C

(1) Stresses beyond those listed under Absolute Maximum Ratings may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions* is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

Copyright © 2010–2014, Texas Instruments Incorporated

8.2 Handling Ratings

			MIN	MAX	UNIT
T_{stg}	Storage temperature range		–55	125	°C
$V_{(ESD)}$	Electrostatic discharge	Human body model (HBM), per ANSI/ESDA/JEDEC JS-001, all pins(1)	–2	2	kV
		Charged device model (CDM), per JEDEC specification JESD22-C101, all pins(2)	–750	750	V

(1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
(2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

8.3 Recommended Operating Conditions

				MIN	NOM	MAX	UNIT
AV_{DD}	Power Supply Voltage Range	Referenced to AVss(1)		1.5	1.8	1.95	V
IOV_{DD}		Referenced to IOVss(1)		1.1		3.6	
Vsys		Referenced to DVss(1)		1.5	1.8	5.5	
DVdd(2)		Referenced to DVss(1)		1.26	1.8	1.95	
D_{VDD_CP}	Power Supply Voltage Range	Referenced to DVss(1)		1.26	1.8	1.95	V
D_{RVDD_HP}		Referenced to AVss(1)	Ground-centered config	1.5	1.8	1.95	
			Unipolar config	1.5		3.6	
	PLL Input Frequency	Clock divider uses fractional divide (D > 0), P = 1, DV_{dd} ≥ 1.65V (See table in SLAU306, *Maximum TLV320AIC3256 Clock Frequencies*)		10		20	MHz
		Clock divider uses integer divide (D = 0), P = 1, DV_{dd} ≥ 1.65V (See table in SLAU306, *Maximum TLV320AIC3256 Clock Frequencies*)		0.512		20	MHz
MCLK	Master Clock Frequency	MCLK; Master Clock Frequency; DV_{dd} ≥ 1.65V				50	MHz
		MCLK; Master Clock Frequency; DV_{dd} ≥ 1.26V				25	
SCL	SCL Clock Frequency					400	kHz
	Audio input max ac signal swing (IN1_L, IN1_R, IN2_L, IN2_R, IN3_L, IN3_R)	CM = 0.75 V		0	0.530	0.75 or AVDD - 0.75(3)	Vpeak
		CM = 0.9 V		0	0.707	0.9 or AVDD - 0.9(3)	Vpeak
LOL, LOR	Stereo line output load resistance			0.6	10		kΩ
HPL, HPR	Stereo headphone output load resistance	Single-ended configuration		14.4	16		Ω
	Headphone output load resistance	Differential configuration		24.4	32		Ω
C_{Lout}	Digital output load capacitance				10		pF
TOPR	Operating Temperature Range			–40		85	°C

(1) All grounds on board are tied together; they must not differ in voltage by more than 0.2V max, for any combination of ground signals.
(2) At DVdd values lower than 1.65V, the PLL does not function. Please see table in SLAU306, *Maximum TLV320AIC3256 Clock Frequencies* for details on maximum clock frequencies.
(3) Whichever is smaller

8.4 Thermal Information

THERMAL METRIC[1]		TLV320AIC3256		UNIT
		RSB (QFN)	YZF (DSGBA)	
		48 PINS	42 PINS	
$R_{\theta JA}$	Junction-to-ambient thermal resistance	32.3	49.7	°C/W
$R_{\theta JCtop}$	Junction-to-case (top) thermal resistance	22.5	0.1	
$R_{\theta JB}$	Junction-to-board thermal resistance	6.1	7.7	
ψ_{JT}	Junction-to-top characterization parameter	0.3	0.1	
ψ_{JB}	Junction-to-board characterization parameter	6	7.7	
$R_{\theta JCbot}$	Junction-to-case (bottom) thermal resistance	1.7	–	

(1) For more information about traditional and new thermal metrics, see the *IC Package Thermal Metrics* application report, SPRA953.

8.5 Electrical Characteristics, ADC

At 25°C, Vsys, AVdd, DVdd, IOVdd, DVdd_CP, DRVdd_HP = 1.8V, f_S (Audio) = 48kHz, C_{REF} = 1µF on REF PIN, PLL and Charge pump disabled unless otherwise noted.

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
AUDIO ADC (CM = 0.9V)						
	Input signal level (for 0dB output)	Single-ended, CM = 0.9V		0.5		V_{RMS}
	Device Setup	1kHz sine wave input Single-ended Configuration IN1_R to Right ADC and IN1_L to Left ADC, R_{IN} = 20kΩ, f_S = 48kHz, AOSR = 128, MCLK = 256 * f_S, PLL Disabled; AGC = OFF, Channel Gain = 0dB, Processing Block = PRB_R1, Power Tune = PTM_R4				
SNR	Signal-to-noise ratio, A-weighted[1] [2]	Inputs ac-shorted to ground	80	93		dB
		IN2_R, IN3_R routed to Right ADC and ac-shorted to ground IN2_L, IN3_L routed to Left ADC and ac-shorted to ground		93		
DR	Dynamic range A-weighted[1] [2]	–60dB full-scale, 1kHz input signal		93		dB
THD+N	Total Harmonic Distortion plus Noise	–3dB full-scale, 1kHz input signal		–84	–70	dB
		IN2_R,IN3_R routed to Right ADC IN2_L, IN3_L routed to Left ADC –3dB full-scale, 1kHz input signal		–84		
AUDIO ADC (CM = 0.75V)						
	Input signal level (for 0dB output)	Single-ended, CM = 0.75V, AVdd = 1.5V		0.375		V_{RMS}
	Device Setup:	1kHz sine wave input Single-ended Configuration INR, IN2_R, IN3_R routed to Right ADC INL, IN2_L, IN3_L routed to Left ADC R_{IN} = 20kΩ, f_S = 48kHz, AOSR = 128, MCLK = 256 * f_S, PLL Disabled, AGC = OFF, Channel Gain = 0dB, Processing Block = PRB_R1 Power Tune = PTM_R4				
SNR	Signal-to-noise ratio, A-weighted [1] [2]	Inputs ac-shorted to ground		90		dB

(1) Ratio of output level with 1kHz full-scale sine wave input, to the output level with the inputs short circuited, measured A-weighted over a 20Hz to 20kHz bandwidth using an audio analyzer.
(2) All performance measurements done with 20kHz low-pass filter and, where noted, A-weighted filter. Failure to use such a filter may result in higher THD+N and lower SNR and dynamic range readings than shown in the Electrical Characteristics. The low-pass filter removes out-of-band noise, which, although not audible, may affect dynamic specification values

8.8 Electrical Characteristics, Audio DAC Outputs

At 25°C, Vsys, AVdd, DVdd, IOVdd, DVdd_CP, DRVdd_HP = 1.8V, f_S (Audio) = 48kHz, C_{REF} = 1µF on REF PIN, PLL and Charge pump disabled unless otherwise noted.

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
AUDIO DAC – STEREO SINGLE-ENDED LINE OUTPUT (CM = 0.9V)						
	Device Setup	Load = 10kΩ (single-ended), 56pF Line Output on AVdd Supply Input and Output CM=0.9V DOSR = 128, MCLK = 256 x f_S, Channel Gain = 0dB, word length = 16 bits, Processing Block = PRB_P1, Power Tune = PTM_P3				
	Full scale output voltage (0dB)			0.5		V_{RMS}
SNR	Signal-to-noise ratio A-weighted (1) (2)	All zeros fed to DAC input	87	100		dB
DR	Dynamic range, A-weighted (1) (2)	–60dB 1kHz input full-scale signal, Word length = 20 bits		100		dB
THD+N	Total Harmonic Distortion plus Noise	–3dB full-scale, 1kHz input signal		–81	–70	dB
	DAC Gain Error	0dB, 1kHz input full scale signal		0.5		dB
	DAC Mute Attenuation	Mute		121		dB
	DAC channel separation	–1dB, 1kHz signal, between left and right HP out		108		dB
	DAC PSRR	100mVpp, 1kHz signal applied to AVdd		72		dB
		100mVpp, 217Hz signal applied to AVdd		80		dB
AUDIO DAC – STEREO SINGLE-ENDED LINE OUTPUT (CM = 0.75V)						
	Device Setup	Load = 10kΩ (single-ended), 56pF Line Output on AVdd Supply Input and Output CM = 0.75V; AVdd = 1.5V DOSR = 128 MCLK=256 x f_S Channel Gain = 0dB word length = 20-bits Processing Block = PRB_P1 Power Tune = PTM_P4				
	Full scale output voltage (0dB)			0.375		V_{RMS}
SNR	Signal-to-noise ratio, A-weighted (1) (2)	All zeros fed to DAC input		99		dB
DR	Dynamic range, A-weighted (1) (2)	–60dB 1kHz input full-scale signal		98		dB
THD+N	Total Harmonic Distortion plus Noise	–1dB full-scale, 1kHz input signal		–77		dB
AUDIO DAC – STEREO SINGLE-ENDED HEADPHONE OUTPUT (GROUND-CENTERED CIRCUIT CONFIGURATION)						
	Device Setup	Load = 16Ω (single-ended), 56pF Input CM = 0.9V, Output CM = 0V DOSR = 128, MCLK = 256x* f_S, Channel Gain = 0dB word length = 16 bits; Processing Block = PRB_P1 Power Tune = PTM_P3				
FS1	Full scale output voltage (for THD ≤ –40dB)			0.65		V_{RMS}
SNR	Signal-to-noise ratio, A-weighted (1) (2)	All zeros fed to DAC input	85	95		dB
DR	Dynamic range, A-weighted (1) (2)	–60dB 1kHz input full-scale signal, Word Length = 20 bits, Power Tune = PTM_P4		93		dB
THD+N	Total Harmonic Distortion plus Noise	500mV_{RMS} output (corresponds to FS1 – 2.3dB), 1-kHz input signal		–70	–55	dB

(1) Ratio of output level with 1kHz full-scale sine wave input, to the output level with the inputs short circuited, measured A-weighted over a 20Hz to 20kHz bandwidth using an audio analyzer.
(2) All performance measured with 20kHz low-pass filter and, where noted, A-weighted filter. Failure to use such a filter may result in higher THD+N and lower SNR and dynamic range readings than shown in the Electrical Characteristics. The low-pass filter removes out-of-band noise, which, although not audible, may affect dynamic specification values.

9 Parameter Measurement Information

All parameters are measured according to the conditions described in the *Specifications* section.

10 Detailed Description

10.1 Overview

The TLV320AIC3256 features two fully-programmable miniDSP cores that support application-specific algorithms in the record and/or the playback path of the device. The miniDSP cores are fully software controlled. Target algorithms are loaded into the device after power-up.

The TLV320AIC3256 includes extensive register-based control of power, input/output channel configuration, gains, effects, pin-multiplexing and clocks, allowing precise targeting of the device to its application. Combined with the advanced PowerTune technology, the device covers operations from 8 kHz mono voice playback to audio stereo 192kHz DAC playback, making it ideal for portable battery-powered audio and telephony applications.

The record path of the TLV320AIC3256 covers operations from 8kHz mono to 192kHz stereo recording, and contains programmable input channel configurations covering single-ended and differential setups, as well as floating or mixing input signals. It also includes a digitally-controlled stereo microphone preamplifier and integrated microphone bias. Digital signal processing blocks can remove audible noise that may be introduced by mechanical coupling, e.g. optical zooming in a digital camera.

The playback path offers signal-processing blocks for filtering and effects, and supports flexible mixing of DAC and analog input signals as well as programmable volume controls. The playback path contains two high-power output drivers which eliminate the need for ac coupling capacitors. A built in charge pump generates the negative supply for the ground centered high powered output drivers. The high-power outputs can be configured in multiple ways, including stereo and mono BTL.

The integrated PowerTune technology allows the device to be tuned to an optimum power-performance trade-off. Mobile applications frequently have multiple use cases requiring very low power operation while being used in a mobile environment. When used in a docked environment power consumption typically is less of a concern, while minimizing noise is important. With PowerTune, the TLV320AIC3256 addresses both cases.

The device offers single supply operation from 1.5V-1.95V. Digital I/O voltages are supported in the range of 1.1V-3.6V.

The required internal clock of the TLV320AIC3256 can be derived from multiple sources, including the MCLK pin, the BCLK pin, the GPIO pin or the output of the internal PLL, where the input to the PLL again can be derived from the MCLK pin, the BCLK or GPIO pins. Although using the PLL ensures the availability of a suitable clock signal, PLL use is not recommended for the lowest power settings. The PLL is highly programmable and can accept available input clocks in the range of 512 kHz to 50 MHz.

10.2 Functional Block Diagram

Figure 19 shows the basic functional blocks of the device.

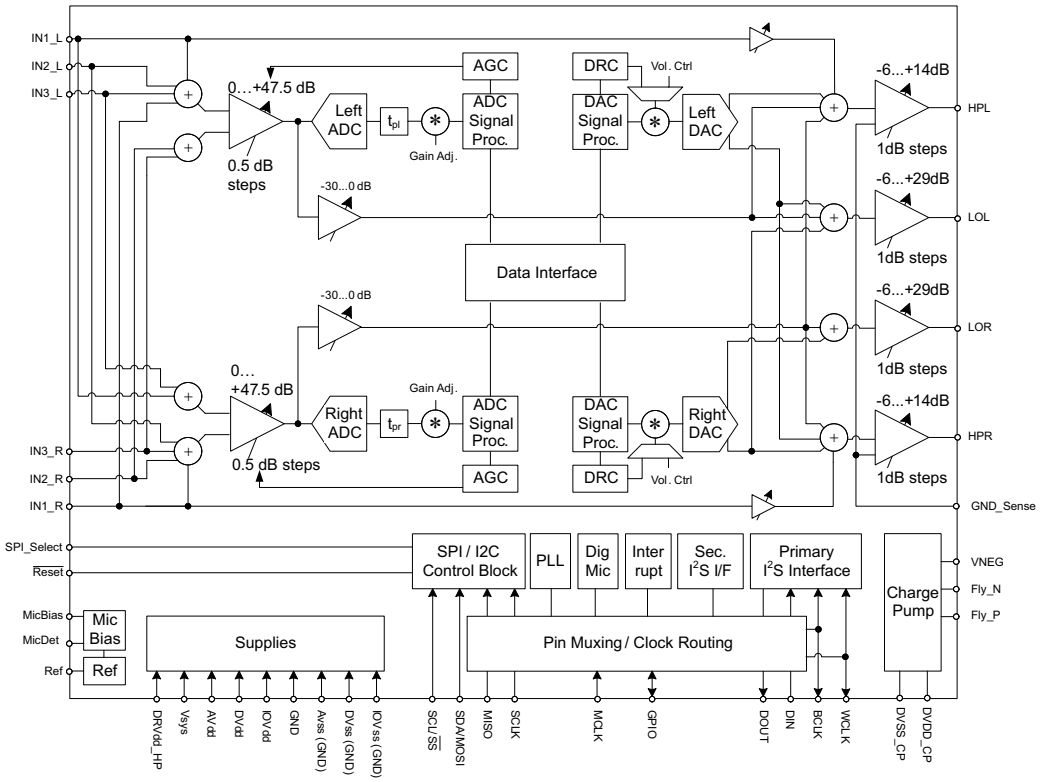

Figure 19. Block Diagram

10.3 Feature Description

10.3.1 Device Connections

10.3.1.1 Digital Pins

Only a small number of digital pins are dedicated to a single function; whenever possible, the digital pins have a default function, and also can be reprogrammed to cover alternative functions for various applications.

The fixed-function pins are $\overline{\text{Reset}}$ and the $\overline{\text{SPI}}$_Select pin, which are HW control pins. Depending on the state of SPI_Select, the two control-bus pins SCL/$\overline{\text{SS}}$ and SDA/MOSI are configured for either I^2C or SPI protocol.

Other digital IO pins can be configured for various functions via register control. An overview of available functionality is given in *Multifunction Pins*.

Feature Description (continued)

10.3.1.1.1 Multifunction Pins

Table 1 shows the possible allocation of pins for specific functions. The PLL input, for example, can be programmed to be any of 4 pins (MCLK, BCLK, DIN, GPIO).

Table 1. Multifunction Pin Assignments

		1	2	3	4	5	6	7	8
	Pin Function	**MCLK**	**BCLK**	**WCLK**	**DIN MFP1**	**DOUT MFP2**	**DMDIN/ MFP3/ SCLK**	**DMCLK/ MFP4/ MISO**	**GPIO MFP5**
A	PLL Input	S(1)	S(2)		E				S(3)
B	Codec Clock Input	S(1),D(4)	S(2)						S(3)
C	I^2S BCLK input		S,D						
D	I^2S BCLK output		E(5)						
E	I^2S WCLK input			E, D					
F	I^2S WCLK output			E					
G	I^2S ADC word clock input						E		E
H	I^2S ADC WCLK out							E	E
I	I^2S DIN				E, D				
J	I^2S DOUT					E, D			
K	General Purpose Output I					E			
K	General Purpose Output II							E	
K	General Purpose Output III								E
L	General Purpose Input I				E				
L	General Purpose Input II						E		
L	General Purpose Input III								E
M	INT1 output					E		E	E
N	INT2 output					E		E	E
Q	Secondary I^2S BCLK input						E		E
R	Secondary I^2S WCLK in						E		E
S	Secondary I^2S DIN						E		E
T	Secondary I^2S DOUT							E	
U	Secondary I^2S BCLK OUT					E		E	E
V	Secondary I^2S WCLK OUT					E		E	E
X	Aux Clock Output					E		E	E

(1) S(1): The MCLK pin can drive the PLL and Codec Clock inputs **simultaneously**.
(2) S(2): The BCLK pin can drive the PLL and Codec Clock and audio interface bit clock inputs **simultaneously**.
(3) S(3): The GPIO/MFP5 pin can drive the PLL and Codec Clock inputs simultaneously.
(4) D: Default Function
(5) E: The pin is **exclusively** used for this function, no other function can be implemented with the same pin. (If GPIO/MFP5 has been allocated for General Purpose Output, it cannot be used as the INT1 output at the same time.)

10.3.1.2 Analog Pins

Analog functions can also be configured to a large degree. For minimum power consumption, analog blocks are powered down by default. The blocks can be powered up with fine granularity according to the application needs.

10.3.2 Analog Audio I/O

The analog IO path of the TLV320AIC3256 features a large set of options for signal conditioning as well as signal routing:

- 6 analog inputs which can be mixed and-or multiplexed in single-ended and-or differential configuration
- 2 programmable gain amplifiers (PGA) with a range of 0 to +47.5dB
- 2 mixer amplifiers for analog bypass

Copyright © 2010–2014, Texas Instruments Incorporated

- 2 low power analog bypass channels
- Mute function
- Channel-to-channel phase adjustment
- Fast charge of ac-coupling capacitors
- Anti thump

10.3.2.1 Analog Bypass

The TLV320AIC3256 offers two analog-bypass modes. In either of the modes, an analog input signal can be routed from an analog input pin to an amplifier driving an analog output pin. Neither the ADC nor the DAC resources are required for such operation.

In analog low-power bypass mode, line-level signals can be routed directly from the analog inputs IN1_L to the left headphone amplifier (HPL) and IN1_R to HPR.

10.3.2.2 ADC Bypass Using Mixer Amplifiers

In addition to the analog low-power bypass mode, another bypass mode uses the programmable gain amplifiers of the input stage in conjunction with a mixer amplifier. With this mode, microphone-level signals can be amplified and routed to the line or headphone outputs, fully bypassing the ADC and DAC.

To enable this mode, the mixer amplifiers are powered on via software command.

10.3.2.3 Headphone Output

The stereo headphone drivers on pins HPL and HPR can drive loads with impedances down to 16Ω in single-ended DC-coupled headphone configurations. An integral charge pump generates the negative supply required to operate the headphone drivers in dc-coupled mode, where the common mode of the output signal is made equal to the ground of the headphone load using a ground-sense circuit. Operation of headphone drivers in dc-coupled (ground centered mode) eliminates the need for large dc-blocking capacitors.

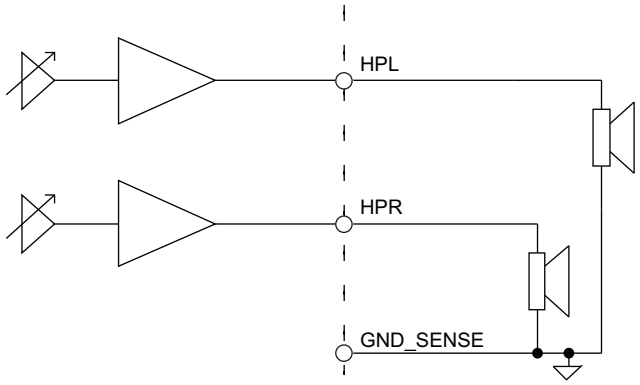

Figure 20. TLV320AIC3256 Ground-Centered Headphone Output

Alternatively the headphone amplifier can also be operated in a unipolar circuit configuration using DC blocking capacitors.

10.3.2.4 Line Outputs

The stereo line level drivers on LOL and LOR pins can drive a wide range of line level resistive impedances in the range of 600Ω to 10kΩ. The output common modes of line level drivers can be configured to equal either the analog input common-mode setting, or 1.65V. With output common-mode setting of 1.65V and DRVdd_HP supply at 3.3V the line-level drivers can drive up to 1Vrms output signal. The line-level drivers can drive out a mixed combination of DAC signal and attenuated ADC PGA signal. Signal mixing is register-programmable.

Copyright © 2010–2014, Texas Instruments Incorporated

10.3.3 ADC

The TLV320AIC3256 includes a stereo audio ADC, which uses a delta-sigma modulator with a programmable oversampling ratio, followed by a digital decimation filter. The ADC supports sampling rates from 8kHz to 192kHz. In order to provide optimal system power management, the stereo recording path can be powered up one channel at a time, to support the case where only mono record capability is required.

The ADC path of the TLV320AIC3256 features a large set of options for signal conditioning as well as signal routing:

- Two ADCs
- Six analog inputs which can be mixed and-or multiplexed in single-ended and-or differential configuration
- Two programmable gain amplifiers (PGA) with a range of 0 to +47.5dB
- Two mixer amplifiers for analog bypass
- Two low power analog bypass channels
- Fine gain adjustment of digital channels with 0.1dB step size
- Digital volume control with a range of -12 to +20dB
- Mute function

In addition to the standard set of ADC features the TLV320AIC3256 also offers the following special functions:

- Channel-to-channel phase adjustment
- Fast charge of ac-coupling capacitors
- Anti thump
- Adaptive filter mode

10.3.3.1 ADC Processing

The TLV320AIC3256 ADC channel includes a built-in digital decimation filter to process the oversampled data from the to generate digital data at Nyquist sampling rate with high dynamic range. The decimation filter can be chosen from three different types, depending on the required frequency response, group delay and sampling rate.

10.3.3.1.1 ADC Processing Blocks

The TLV320AIC3256 offers a range of processing blocks which implement various signal processing capabilities along with decimation filtering. These processing blocks give users the choice of how much and what type of signal processing they may use and which decimation filter is applied.

The choice between these processing blocks is part of the PowerTune strategy to balance power conservation and signal-processing flexibility. Less signal-processing capability reduces the power consumed by the device. Table 2 gives an overview of the available processing blocks and their properties. The Resource Class Column (RC) gives an approximate indication of power consumption.

The signal processing blocks available are:

- First-order IIR
- Scalable number of biquad filters
- Variable-tap FIR filter

The processing blocks are tuned for common cases and can achieve high anti-alias filtering or low group delay in combination with various signal processing effects such as audio effects and frequency shaping. The available first order IIR, BiQuad and FIR filters have fully user-programmable coefficients. The Resource Class Column (RC) gives an approximate indication of power consumption.

(1) Default

For more detailed information see the TLV320AIC3256 Application Reference Guide, SLAU306.

10.3.4 DAC

The TLV320AIC3256 includes a stereo audio DAC supporting data rates from 8kHz to 192kHz. Each channel of the stereo audio DAC consists of a signal-processing engine with fixed processing blocks, a programmable miniDSP, a digital interpolation filter, multi-bit digital delta-sigma modulator, and an analog reconstruction filter. The DAC is designed to provide enhanced performance at low sampling rates through increased oversampling and image filtering, thereby keeping quantization noise generated within the delta-sigma modulator and signal images strongly suppressed within the audio band to beyond 20kHz. To handle multiple input rates and optimize power dissipation and performance, the TLV320AIC3256 allows the system designer to program the oversampling rates over a wide range from 1 to 1024. The system designer can choose higher oversampling ratios for lower input data rates and lower oversampling ratios for higher input data rates.

The TLV320AIC3256 DAC channel includes a built-in digital interpolation filter to generate oversampled data for the sigma-delta modulator. The interpolation filter can be chosen from three different types depending on required frequency response, group delay and sampling rate.

The DAC path of the TLV320AIC3256 features many options for signal conditioning and signal routing:

- 2 headphone amplifiers
  - Ground-centered, bipolar operation or unipolar operation
  - Usable in single-ended or differential mode
  - Analog volume setting with a range of -6 to +14dB
- 2 line-out amplifiers
  - Usable in single-ended or differential mode
  - Analog volume setting with a range of -6 to +29dB
- Digital volume control with a range of -63.5 to +24dB
- Mute function
- Dynamic range compression (DRC)

Copyright © 2010–2014, Texas Instruments Incorporated

In addition to the standard set of DAC features the TLV320AIC3256 also offers the following special features:

- Built in sine wave generation (beep generator)
- Digital auto mute
- Adaptive filter mode

(1) Default

For more detailed information see the TLV320AIC3256 Application Reference Guide, SLAU306.

10.3.5 PowerTune

The TLV320AIC3256 features PowerTune, a mechanism to balance power-versus-performance trade-offs at the time of device configuration. The device can be tuned to minimize power dissipation, to maximize performance, or to an operating point between the two extremes to best fit the application. The TLV320AIC3256 PowerTune modes are called PTM_R1 to PTM_R4 for the recording (ADC) path and PTM_P1 to PTM_P4 for the playback (DAC) path.

For more detailed information see the TLV320AIC3256 Application Reference Guide, SLAU306.

10.3.6 Digital Audio IO Interface

Audio data flows between the host processor and the TLV320AIC3256 on the digital audio data serial interface, or audio bus. This very flexible bus includes left or right-justified data options, support for I^2S or PCM protocols, programmable data length options, a TDM mode for multichannel operation, very flexible master-slave configurability for each bus clock line, and the ability to communicate with multiple devices within a system directly.

The audio bus of the TLV320AIC3256 can be configured for left or right-justified, I^2S, DSP, or TDM modes of operation, where communication with standard PCM interfaces is supported within the TDM mode. These modes are all MSB-first, with data width programmable as 16, 20, 24, or 32 bits by configuring Page 0, Register 27, D(5:4). In addition, the word clock and bit clock can be independently configured in either Master or Slave mode, for flexible connectivity to a wide variety of processors. The word clock is used to define the beginning of a frame, and may be programmed as either a pulse or a square-wave signal. The frequency of this clock corresponds to the maximum of the selected ADC and DAC sampling frequencies.

The bit clock is used to clock in and clock out the digital audio data across the serial bus. When in Master mode, this signal can be programmed to generate variable clock pulses by controlling the bit-clock divider in Page 0, Register 30. The number of bit-clock pulses in a frame may need adjustment to accommodate various word lengths, and to support the case when multiple TLV320AIC3256s may share the same audio bus.

The TLV320AIC3256 also includes a feature to offset the position of start of data transfer with respect to the word-clock. Control the offset in terms of number of bit-clocks by programming Page 0, Register 28.

The TLV320AIC3256 also has the feature to invert the polarity of the bit-clock used to transfer the audio data as compared to the default clock polarity used. This feature can be used independently of the mode of audio interface chosen. Page 0, Register 29, D(3) configures bit clock polarity.

The TLV320AIC3256 further includes programmability (Page 0, Register 27, D(0)) to place the DOUT line into a hi-Z (3-state) condition during all bit clocks when valid data is not being sent. By combining this capability with the ability to program at what bit clock in a frame the audio data begins, time-division multiplexing (TDM) can be accomplished, enabling the use of multiple codecs on a single audio serial data bus. When the audio serial data bus is powered down while configured in master mode, the pins associated with the interface are put into a hi-Z output condition.

By default when the word-clocks and bit-clocks are generated by the TLV320AIC3256, these clocks are active only when the codec (ADC, DAC or both) are powered up within the device. This intermittent clock operation reduces power consumption. However, it also supports a feature when both the word clocks and bit-clocks can be active even when the codec in the device is powered down. This continuous clock feature is useful when using the TDM mode with multiple codecs on the same bus, or when word-clock or bit-clocks are used in the system as general-purpose clocks.

10.3.7 Clock Generation and PLL

The TLV320AIC3256 supports a wide range of options for generating clocks for the ADC and DAC sections as well as interface and other control blocks. The clocks for ADC and DAC require a source reference clock. This clock can be provided on variety of device pins such as MCLK, BCLK or GPI pins. The CODEC_CLKIN can then be routed through highly-flexible clock dividers to generate the various clocks required for ADC, DAC and the miniDSP sections. In the event that the desired audio or miniDSP clocks cannot be generated from the reference clocks on MCLK BCLK or GPIO, the TLV320AIC3256 also provides the option of using the on-chip PLL which supports a wide range of fractional multiplication values to generate the required clocks. Starting from CODEC_CLKIN the TLV320AIC3256 provides several programmable clock dividers to help achieve a variety of sampling rates for ADC, DAC and clocks for the miniDSP.

To minimize power consumption, the system ideally provides a master clock that is a suitable integer multiple of the desired sampling frequencies. In such cases, internal dividers can be programmed to set up the required internal clock signals at very low power consumption. For cases where such master clocks are not available, the built-in PLL can be used to generate a clock signal that serves as an internal master clock. In fact, this master clock can also be routed to an output pin and may be used elsewhere in the system. The clock system is flexible enough that it even allows the internal clocks to be derived directly from an external clock source, while the PLL is used to generate some other clock that is only used outside the TLV320AIC3256.

For more detailed information see the TLV320AIC3256 Application Reference Guide, SLAU306.

Copyright © 2010–2014, Texas Instruments Incorporated

10.3.8 Control Interfaces

The TLV320AIC3256 control interface supports SPI or I^{2}C communication protocols, with the protocol selectable using the SPI_SELECT pin. For SPI, SPI_SELECT should be tied high; for I^{2}C, SPI_SELECT should be tied low. Changing the state of SPI_SELECT during device operation is not recommended.

10.3.8.1 I^{2}C Control

The TLV320AIC3256 supports the I^{2}C control protocol, and will respond to the I^{2}C address of 0011000. I^{2}C is a two-wire, open-drain interface supporting multiple devices and masters on a single bus. Devices on the I^{2}C bus only drive the bus lines LOW by connecting them to ground; they never drive the bus lines HIGH. Instead, the bus wires are pulled HIGH by pullup resistors, so the bus wires are HIGH when no device is driving them LOW. This circuit prevents two devices from conflicting; if two devices drive the bus simultaneously, there is no driver contention.

10.3.8.2 SPI Control

In the SPI control mode, the TLV320AIC3256 uses the pins SCL/$\overline{SS}$ as $\overline{SS}$, SCLK as SCLK, MISO as MISO, SDA/MOSI as MOSI; a standard SPI port with clock polarity setting of 0 (typical microprocessor SPI control bit CPOL = 0). The SPI port allows full-duplex, synchronous, serial communication between a host processor (the master) and peripheral devices (slaves). The SPI master (in this case, the host processor) generates the synchronizing clock (driven onto SCLK) and initiates transmissions. The SPI slave devices (such as the TLV320AIC3256) depend on a master to start and synchronize transmissions. A transmission begins when initiated by an SPI master. The byte from the SPI master begins shifting in on the slave MOSI pin under the control of the master serial clock (driven onto SCLK). As the byte shifts in on the MOSI pin, a byte shifts out on the MISO pin to the master shift register.

For more detailed information see the TLV320AIC3256 Application Reference Guide, SLAU306.

10.4 Device Functional Modes

The following special functions are available to support advanced system requirements:

- Headset detection
- Interrupt generation
- Flexible pin multiplexing

For more detailed information see the TLV320AIC3256 Application Reference Guide, SLAU306.

10.4.1 MiniDSP

The TLV320AIC3256 features two miniDSP cores. The first miniDSP core is tightly coupled to the ADC, the second miniDSP core is tightly coupled to the DAC. The fully programmable algorithms for the miniDSP must be loaded into the device after power up. The miniDSPs have direct access to the digital stereo audio stream on the ADC and on the DAC side, offering the possibility for advanced, very-low group delay DSP algorithms. Each miniDSP can run up to 1152 instructions on every audio sample at a 48kHz sample rate. The two cores can run fully synchronized and can exchange data.

10.4.2 Software

Software development for the TLV320AIC3256 is supported through TI's comprehensive PurePath Studio Development Environment; a powerful, easy-to-use tool designed specifically to simplify software development on the TLV320AIC3256 miniDSP audio platform. The Graphical Development Environment consists of a library of common audio functions that can be dragged-and-dropped into an audio signal flow and graphically connected together. The DSP code can then be assembled from the graphical signal flow with the click of a mouse.

Please visit the TLV320AIC3256 product folder on www.ti.com to learn more about PurePath Studio and the latest status on available, ready-to-use DSP algorithms.

11 Application and Implementation

NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

11.1 Application Information

The TLV320AIC3256 is a highly integrated stereo audio codec with integrated miniDSP and flexible digital audio interface options. It enables many different types of audio platforms having a need for stereo audio record and playback and needing to interface with other devices in the system over a digital audio interface.

11.2 Typical Application

Figure 21 shows a typical circuit configuration for a system using theTLV320AIC3256.

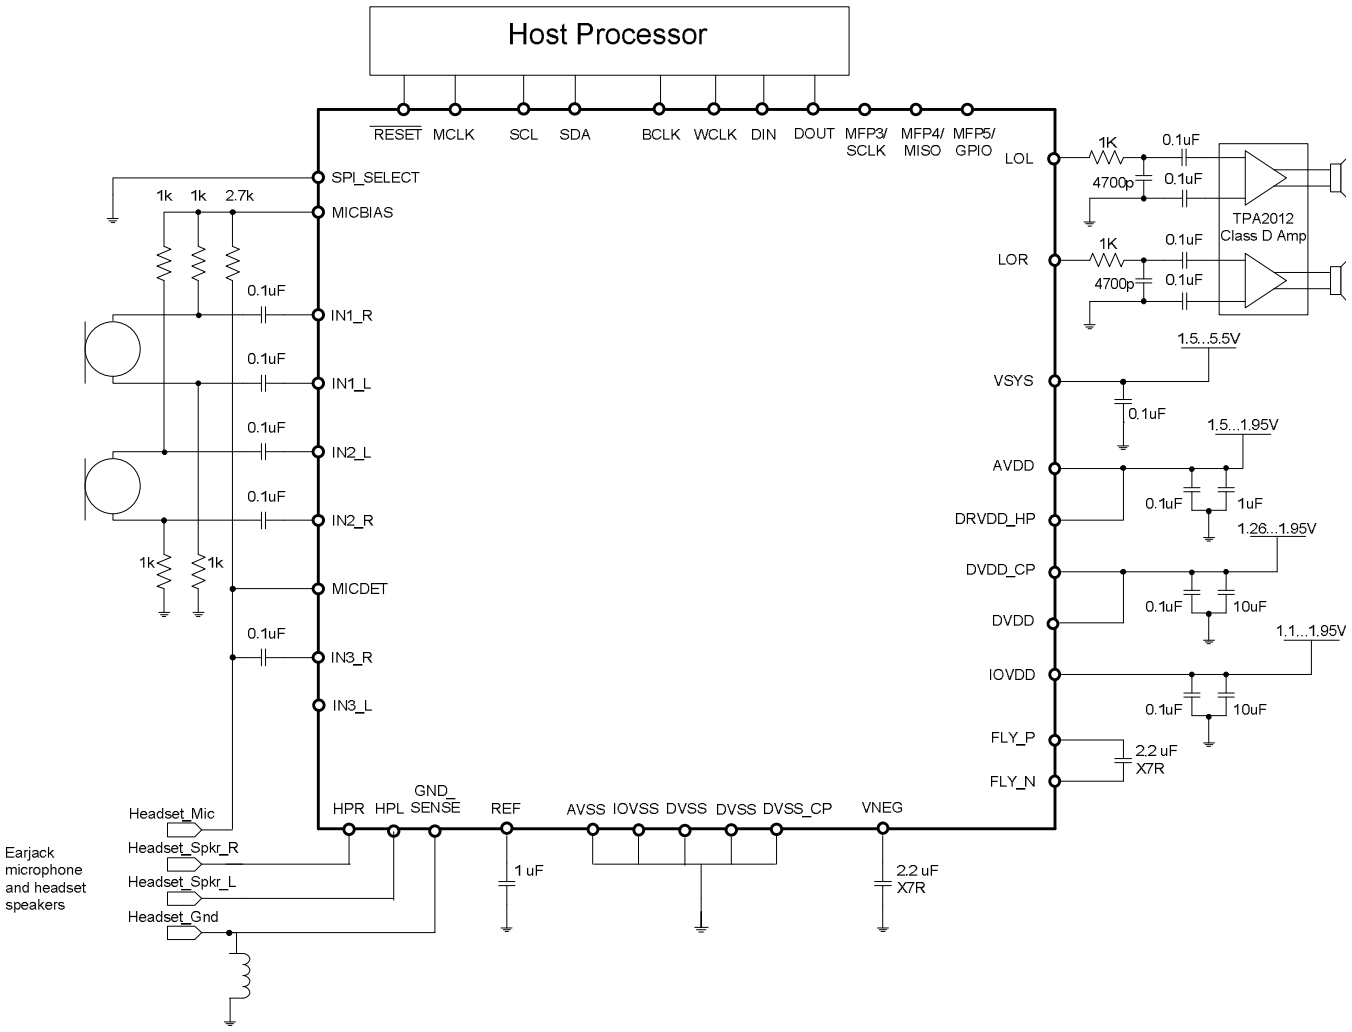

Figure 21. Typical Circuit Configuration

Typical Application (continued)

11.2.1 Design Requirements

11.2.1.1 Charge Pump Flying and Holding Capacitor

The TLV320AIC3256 features a built in charge-pump to generate a negative supply rail, VNEG from DVDD_CP. This negative voltage is used by the headphone amplifier to enable driving the output signal biased around ground potential. For proper operation of the charge pump and headphone amplifier, it is recommended that the flying capacitor connected between FLY_P and FLY_N terminals and the holding capacitor connected between VNEG and ground be of X7R type. It is recommended to use 2.2µF as capacitor values. Failure to use X7R type capacitor can result in degraded performance of charge pump and headphone amplifier.

11.2.1.2 Reference Filtering Capacitor

The TLV320AIC3256 has a built-in bandgap used to generate reference voltages and currents for the device. To achieve high SNR, the reference voltage on REF should be filtered using a 10-µF capacitor from REF terminal to ground.

11.2.1.3 MICBIAS

The TLV320AIC3256 has a built-in bias voltage output for biasing of microphones. No intentional capacitors should be connected directly to the MICBIAS output for filtering.

11.2.2 Detailed Design Procedures

11.2.2.1 Analog Input Connection

The analog inputs to TLV320AIC3256 should be ac-coupled to the device terminals to allow decoupling of signal source's common mode voltage with that of TLV320AIC3256's common mode voltage. The input coupling capacitor in combination with the selected input impedance of TLV320AIC3256 forms a high-pass filter.

$$F_c = 1/(2 \times \pi \times R_{eq}C_c) \quad (1)$$

$$C_c = 1/(2 \times \pi \times R_{eq}F_c) \quad (2)$$

For high fidelity audio recording application it is desirable to keep the cutoff frequency of the high pass filter as low as possible. For single-ended input mode, the equivalent input resistance R_{eq} can be calculated as

$$R_{eq} = R_{in} \times (1 + 2g)/(1+g) \quad (3)$$

where g is the analog PGA gain calculated in linear terms.

$$g = 10000 \times 2^{floor(G/6)}/R_{in} \quad (4)$$

where G is the analog PGA gain programmed in P1_R59-R60 (in dB) and R_{in} is the value of the resistor programmed in P1_R52-R57 and assumes $R_{in} = R_{cm}$ (as defined in P1_R52-R57).

For differential input mode, R_{eq} of the half circuit can be calculated as:

$$R_{eq} = R_{in} \quad (5)$$

where R_{in} is the value of the resistor programmed in P1_R52-R57, assuming symmetrical inputs.

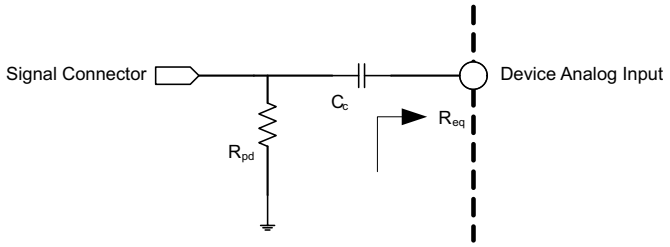

Figure 22. Analog Input Connection With Pull-down Resistor

Copyright © 2010–2014, Texas Instruments Incorporated

Typical Application (continued)

When the analog signal is connected to the system through a connector such as audio jack, it is recommended to put a pull-down resistor on the signal as shown in Figure 22. The pulldown resistor helps keep the signal grounded and helps improve noise immunity when no source is connected to the connector. The pulldown resistor value should be chosen large enough to avoid loading of signal source.

Each analog input of the TLV320AIC3256 is capable of handling signal amplitude of 0.5 Vrms. If the input signal source can drive signals higher than the maximum value, an external resistor divider network as shown in Figure 23 should be used to attenuate the signal to less than 0.5Vrms before connecting the signal to the device. The resistor values of the network should be chosen to provide desired attenuation as well as Equation 6.

$$R_1 || R_2 << R_{eq} \quad (6)$$

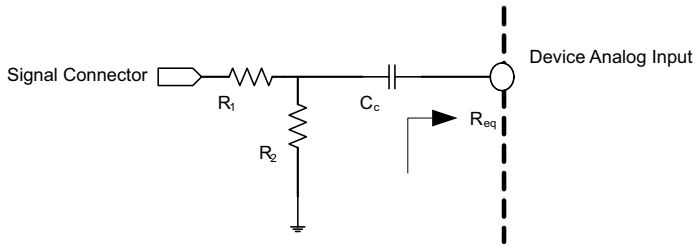

Figure 23. Analog Input Connection With Resistor Divider Network

Whenever any of the analog input terminals IN1_L, IN2_L, IN3_L, IN1_R, IN2_R or IN3_R are not used in an application, it is recommended to short the unused input terminals together (if convenient) and connect them to ground using a small capacitor (example 0.1 µF).

11.2.2.2 Analog Output Connection

The line and headphone outputs of the TLV320AIC3256 drive a signal biased around the device common mode voltage. To avoid loading the common mode with the load, it is recommended to connect the single-ended load through an ac-coupling capacitor. The ac-coupling capacitor in combination with the load impedance forms a high pass filter.

$$F_c = 1/(2 \times \pi \times R_L C_c) \quad (7)$$

$$C_c = 1/(2 \times \pi \times R_L F_c) \quad (8)$$

For high fidelity playback, the cutoff frequency of the resultant high-pass filter should be kept low. For example with R_L of 10 kΩ, using 1-µF coupling capacitor results in a cut-off frequency of 8 Hz.

For differential lineout configurations, the load should be directly connected between the differential outputs, with no coupling capacitor.

The TLV320AIC3256 supports headphone in single-ended configuration and drives the signal biased around ground. The headphone load can be directly connected between device terminals and ground.

Whenever any of the analog output terminals LOL, LOR, HPL or HPR are not used in an application, they should be left open or not connected.

12 Power Supply Recommendations

Device power consumption largely depends on PowerTune configuration.

The device has an integrated charge pump. In ground-centered headphone configuration, all supplies can be conveniently supplied from a single 1.5V to 1.95V rail. The device has separate power domains for digital IO, digital core, analog core, charge-pump input and headphone drive, all of which can be connected together and be supplied from one source. For improved power efficiency, the digital core voltage can range from 1.26V to 1.95V. The IO voltage can be supplied in the range of 1.1V to 3.6V.

The device power supply Vsys can be supplied in the range of 1.5V to 5.5V. Vsys must always be greater than or equal to AVdd and DVdd voltages.

The AVDD, DRVDD_HP and DVDD_CP power inputs are used to power the analog circuits including analog to digital converters, digital to analog converters, programmable gain amplifiers, headphone amplifiers, charge pump etc. The analog blocks in TLV320AIC3256 have high power supply rejection ratio, however it is recommended that these supplies be powered by well regulated power supplies like low dropout regulators (LDO) for optimal performance. When these power terminals are driven from a common power source, the current drawn from the source will depend upon blocks enabled inside the device. However as an example when all the internal blocks powered are enabled the source should be able to deliver 150mA of current.

The DVDD powers the digital core of TLV320AIC3256, including the miniDSP, the audio serial interface, control interfaces (SPI or I2C), clock generation and PLL. The DVDD power can be driven by high efficiency switching regulators or low drop out regulators. When the miniDSP_A and miniDSP_D are enabled in programmable mode and operated at peak frequencies, the supply source should be able to able to deliver approx 100mA of current. When the PRB modes are used instead of programmable miniDSP mode, then the peak current load on DVDD supply source could be approximately 20 mA.

The IOVDD powers the digital input and digital output buffers of TLV320AIC3256. The current consumption of this power depends on configuration of digital terminals as inputs or outputs. When the digital terminals are configured as outputs, the current consumption would depend on switching frequency of the signal and the load on the output terminal, which depends on board design and input capacitance of other devices connected to the signal.

Refer to Figure 21 for recommendations on decoupling capacitors.

For more detailed information see the TLV320AIC3256 Application Reference Guide, SLAU306.

13 Layout

13.1 Layout Guidelines

Each system design and PCB layout is unique. The layout should be carefully reviewed in the context of a specific PCB design. However, the following guidelines can optimize TLV320AIC3256 performance:

- Connect the thermal pad to ground.
- The decoupling capacitors for the power supplies should be placed close to the device terminals. Figure 21 shows the recommended decoupling capacitors for the TLV320AIC3256.
- Place the flying capacitor between FLY_P and FLY_N near the device terminals, with no VIAS in the trace between the device terminals and the capacitor. Similarly, keep the decoupling capacitor on VNEG near the device terminal with minimal VIAS in the trace between the device terminals, capacitor and PCB ground.
- The TLV320AIC3256 internal voltage references must be filtered using external capacitors. Place the filter capacitors on REF near the device terminals for optimal performance.
- The TLV320AIC3256 reduces crosstalk by a separate ground sense signal for the headphone jack. To optimize crosstalk performance, use a separate trace from the HPVSS_SENSE terminal to the headphone jack ground terminal, with no other ground connections along the length.
- For analog differential audio signals, the signals should be routed differentially on the PCB for better noise immunity. Avoid crossing of digital and analog signals to avoid undesirable crosstalk.

(1) **Status:** For more details on status, see our product life cycle.

(2) **Material type:** When designated, preproduction parts are prototypes/experimental devices, and are not yet approved or released for full production. Testing and final process, including without limitation quality assurance, reliability performance testing, and/or process qualification, may not yet be complete, and this item is subject to further changes or possible discontinuation. If available for ordering, purchases will be subject to an additional waiver at checkout, and are intended for early internal evaluation purposes only. These items are sold without warranties of any kind.

(3) **RoHS values:** Yes, No, RoHS Exempt. See the TI RoHS Statement for additional information and value definition.

(4) **Lead finish/Ball material:** Parts may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

(5) **MSL rating/Peak reflow:** The moisture sensitivity level ratings and peak solder (reflow) temperatures. In the event that a part has multiple moisture sensitivity ratings, only the lowest level per JEDEC standards is shown. Refer to the shipping label for the actual reflow temperature that will be used to mount the part to the printed circuit board.

(6) **Part marking:** There may be an additional marking, which relates to the logo, the lot trace code information, or the environmental category of the part.

Multiple part markings will be inside parentheses. Only one part marking contained in parentheses and separated by a "~" will appear on a part. If a line is indented then it is a continuation of the previous line and the two combined represent the entire part marking for that device.
